SELECTED  
RESEARCH  
PROJECTS

**Distributed and Adaptive Feature Compression**

- Proposed an adaptive scheme using deep neural networks for optimizing data compression in distributed sensor network without compromising performance of downstream task.
- Applications: Internet of Things (IoT) devices, edge computing.

**Robust Estimation**

- Introduced a novel optimization framework and devised a computationally efficient, outlier-fraction agnostic, optimal estimator for the problem of robust mean estimation
- Applications: Robust federated learning, robust LDA, robust linear regression.

**Hypothesis Testing in Multi-Armed Bandits**

- Formulated a general framework of hypothesis testing which encompasses identification problems (e.g. top- $k$  arms identification) in multi-armed bandits, and proposed an asymptotically optimal policy for quickest detection.
- Applications: Medical diagnostic systems, recommendation systems, clinical trials.
